

Tecsys Healthcare Laboratory Capabilities

RFID Tracking

Using accurate real-time data, RFID tracking facilitates management of inventory levels to reduce on-hand inventory value. It offers advanced traceability capabilities that prevent product expiry, reduce product loss and avoid costly stock outs.

Clinical lab gains include:

Automated replenishment

Data capture of product usage

Inventory visibility across different locations

Reduced waste and revenue

Patient Specimen Tracking

Every health system must move patient specimens with temperature and time control, package patient records properly with complete chain of custody and secure clinical receipts with full visibility and proof of delivery.

A full chain of custody allows you to see inbound and outbound delivery details for:

Pickup of specimens

Temperature notification

On demand 'Stat' calls

Drop box management

Proof of delivery and delivery time

Inventory management solutions for laboratories can substantially reduce human intervention for tracking and managing lot control while enhancing the quality and availability of pertinent information. It is also critical to effectively track lab specimens by individual patient and manage the entire delivery network of these items.
